

Web:

1. After some time, when employee does not interact with the Benefits page, then when he try to add new employee, the backend API call is returning status code 401 Unathorized. When user log out and log in again, then adding of new employee is functional.
2. After some time, when employee does not interact with the Benefits page, then when he try to reload the page,the backend GET call is returning status code 401 Unathorized and we do not see any table at all, as there was no eployee. We should see some warning that log session expired When user log out and log in again, then GET call is succesful and user of new employee is functional.

Add Employee								

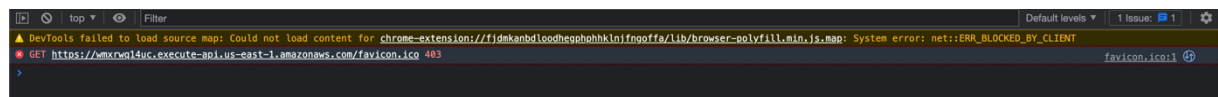

3. After some time, when employee does not interact with the Benefits page, then when he reloads the page the session expired and we do not see any table. The log out button is missing, so user must load the login url again (not the current url)
4. When employee add high value of Dependants, for example 1 000, the request returns status code 400 bad Bad request. I would expect there some UI warning informing employee that entered value is not within allowed range

5. When employee add high value of Dependants, for example 100 000, the request returns status code 500 Internal server error. I would expect there some UI warning informing employee that entered value is not within allowed range

6. Loading of some icon is failing

7. When I try to add employee with too long First or Last name (many of characters) then request is returning status code 400. I would expect some warning that name is too long.

8. When I add too long first and last name, then table is not formatted correctly

[Add Employee](#)

9. I can add user with exactly the same first and last name, then only difference is the client id

Direct API calls

10. When I call any request without authorization token, or with bad value of token, then it returns status code 500 Internal server error, I would expect 401 Unauthorized
11. When I send DELETE request with invalid id, status code is 500 Internal server error, I would expect 404 Not found
12. When I send POST request with invalid parameter, for example in the body „dependantss“ instead of „dependants“
13. I can send POST request with missing the parameter „dependants“, then value 0 is saved, this is like default behaviour maybe OK, but I would still suggest warning that „dependants“ value must be defined
14. When I try Get employee request, with non existing user id, then status code 500 Internal server is returned, I would expect 404 Not found or also some warning that user was not found or that incorrect id was used
15. When sending PUT Update employee request with missing user id, status code 500 Internal Server error is returned. I would expect
